

OHI R Package: Version 0.9.12

November 16, 2013

Version 0.9.12

Date 2013-06-15

Title Ocean Health Index

Author ``Ben Best" <bbest@nceas.ucsb.edu>, with past contributions from ``Darren Hardy" <drh@stanford.edu>

Maintainer ``Ben Best" <bbest@nceas.ucsb.edu>

Depends R (>= 2.10)

Imports ggplot2 (>= 0.9), knitr (>= 1.1), markdown (>= 0.5.4), pander (>= 0.3.1), plyr (>= 1.8), RColorBrewer (>= 1.0), RJSONIO (>= 1.0), reshape (>= 0.8), reshape2 (>= 1.2), shiny (>= 0.6.0), utils (>= 3.0)

Description Data and methods for Ocean Health Index.

aggregate_to_region	<i>Check and Assemble Layers</i>
---------------------	----------------------------------

Description

Check all the input layers as defined by layers_navigation.csv, found in dir.layers and assembled out to a consolidated layers_data.csv for easy data extraction.

Usage

```
aggregate_by_country(df, col.value=value, col.country=country_id)
aggregate_weighted(df, w, col.value=value, col.country=country_id, col.weight=weight)
aggregate_by_country_year(df, col.value=value, col.country=country_id)
```

Arguments

df	Input data frame.
col.value	Column in data frame containing the value to be aggregated.
col.country	Column in data frame containing the country_id.
col.weight	Column in data frame containing the weight.

Value

These functions aggregate to region by either country, country and year, or just a weight. These are mostly only used for aggregating a goal’s status or trend calculations to region.

Examples

```
## Not run:
  aggregate_by_country(df, col.value=value, col.country=country_id)
  aggregate_weighted(df, w, col.value=value, col.country=country_id, col.weight=weight)
  aggregate_by_country_year(df, col.value=value, col.country=country_id)

## End(Not run)
```

allregions	<i>Ocean Health Index: Global regions</i>
------------	---

Description

Functions to join with global regions

Usage

```
allregions(d = NULL, scope = all)
ohi.global.regions.all
ohi.global.regions.eez
ohi.global.regions.highseas
```

Arguments

d	The data frame to join with. If NULL, returns all regions.
scope	'all' for all global regions, or 'eez' for EEZ/country regions.

Value

Returns a data.frame containing a left join of regions.

See Also

merge

Examples

```
d <- data.frame(id=1:50, status=runif(50, 0, 1))
allregions(d) # returns status=NA for all but the first 50 regions
ohi.load(regions_details)
```

aster	<i>Plot Aster</i>
-------	-------------------

Description

Plot flower plot. Created by Jim Regetz. Slight modifications by Darren and Ben.

Usage

```
aster(lengths, widths, labels, disk=0.5, max.length,
      center=NULL, main=NULL, fill.col=NULL, plot.outline=TRUE,
      label.offset=0.15, xlim=c(-1.2, 1.2), ylim=c(-1.2, 1.2), uin=NULL,
      tol=0.04, cex=1, bty="n", lty=1,
      label.col=black, label.font=3, label.cex=NULL, ...)
```

Arguments

<code>lengths</code>	length of petal outward to extent of circle
<code>widths</code>	width of petal
<code>labels</code>	petal label outside of circle
<code>disk</code>	relative radius of a central donut hole
<code>max.length</code>	...
<code>center</code>	center value
<code>main</code>	
<code>fill.col</code>	
<code>plot.outline</code>	
<code>label.offset</code>	
<code>xlim</code>	
<code>ylim</code>	
<code>uin</code>	
<code>tol</code>	
<code>cex</code>	
<code>bty</code>	
<code>lty</code>	
<code>label.col</code>	
<code>label.font</code>	
<code>label.cex</code>	

Value

Generate something akin to a rose plot in which the width and length of each petal are directly specified by the user. Or to put it differently, this is somewhat like a pie chart in which the radius of each wedge is allowed to vary (along with the angular width, as pie charts do). As an additional enhancement, one can specify a central disk of arbitrary radius (from 0 to 1, assuming that the plot itself is scaled to the unit circle), in which case the petal heights are always measured from the edge of the disk rather than the center of the circle; if desired, text can be added in the center.

Although this kind of plot may already be well known in some circles (no pun intended), I haven't seen it clearly defined or labeled anywhere, so I'm anointing it an 'aster' plot because its component parts are reminiscent of composite flower morphology.

The 'lengths' dictates how far out each petal extends, 'widths' dictates the (angular) width of each petal, and 'disk' gives the relative radius of a central donut hole. If no widths are provided, all petals will have equal widths. Additional function arguments can also control whether petals are labeled, whether the petal lengths are rescaled to the maximum score or to a user-input score, whether spokes delineating each petal are extended to an outer circle, and more. I also wrote a quick convenience wrapper for creating a legend plot.

Note that the function here is a repurposed and very heavily modified version of the `windrose()` function contained in the 'circular' package, although sufficiently rewritten so as not to depend on any functionality in that package.

Examples

```
## Not run:
# generate some fake data
set.seed(1)
scores <- sample(1:10)
weights <- sample(1:10)
labels <- paste(LETTERS[1:10], "X", sep="")

# do some plots
par(mfrow=c(2,2), xpd=NA)
aster(lengths=scores, widths=weights, disk=0, main="Example 1",
      plot.outline=FALSE)
aster(lengths=scores, widths=weights, labels=labels, main="Example 2",
      lty=2, fill.col="gray", plot.outline=FALSE)
aster.legend(labels=labels, widths=weights)
aster(lengths=scores, widths=weights, disk=0.5, main="Example 3",
      center="Hello world")

## End(Not run)
```

launchApp

Ocean Health Index: Launch Application

Description

Launch a graphical user interface to inspect and do basic calculations of OHI.

Usage

```
launchApp(config.R)
```

Arguments

config.R Full path to the configuration file. See Details below.

Value

Opens an application in your local browser using the Shiny R package to interface between the web browser and R.

Examples

```
## Not run:
launchApp(~/ohi/scenarios/global_2012_nature/conf/config.R)

## End(Not run)
```

layers_navigation	<i>Check and Assemble Layers</i>
-------------------	----------------------------------

Description

Check all the input layers as defined by layers_navigation.csv, found in dir.layers and assembled out to a consolidated layers_data.csv for easy data extraction.

Usage

```
check.layers_navigation(layers_navigation.csv, dir.layers, layers_id_fields)
assemble.layers_data(layers_navigation.csv, dir.layers, layers_data.csv, layers_id_fields)
```

Arguments

layers_navigation.csv	Full path to the layers_navigation.csv file.
dir.layers	Full path to the directory containing the layers files.
layers_data.csv	Combined data table output of all layers dir.layers based on descriptions in layers_navigation.
layers_id_fields	Character vector of unique identifiers typically spatial (eg region_id, country_id, saup_id).

Value

All of these parameters should be defined in config.R.

The check.layers_navigation() function iterates through the layers_navigation.csv and checks for the existence of all the input files and looks for matching fields. Any unused fields should be dealt with before moving onto using assemble.layers_data.

The assemble.layers_data() function reads in all data layers and combines them into a single data table layers_data.csv.

Examples

```
## Not run:
config.R = ~/ohi/scenarios/global_2012_nature/conf/config.R
source(config.R)
check.layers_navigation(layers_navigation.csv, dir.layers, layers_id_fields)
assemble.layers_data(layers_navigation.csv, dir.layers, layers_data.csv, layers_id_fields)

## End(Not run)
```

ohi	<i>Ocean Health Index</i>
-----	---------------------------

Description

The Ocean Health Index package provides goal model functions and data from global study results.

Examples

```
ohi.version
```

ohi-file	<i>Ocean Health Index: Data file format</i>
----------	---

Description

Simple read/write utility functions for the CSV and RData data file format.

Usage

```
ohi.read.csv(file, na.strings = "", row.names = NULL, ...)
ohi.write.csv(x, file, digits = NULL, row.names = F, na = "", ...)

ohi.load(name, dir=data, method=c(RData, csv), envir=.GlobalEnv)
ohi.save(name, dir=data, method=c(RData, csv), ...)

ohi.loadbin(name, dir=data, envir=.GlobalEnv)
ohi.savebin(name, dir=data, ...)
ohi.savetxt(name, dir=data, ...)

ohi.save.results(xdim, dir)
ohi.save.status(dir=..)
ohi.save.trend(dir=..)
ohi.save.pressures(dir=..)
ohi.save.resilience(dir=..)
```

Arguments

file	Full path to input/output file.
x	A data frame with data to write.
digits	Use to restrict ASCII representation of doubles.
row.names	Do not use them by default
na.strings	Use blanks for NA.
na	Use blanks for NA.

dir	The directory to use.
method	The data file format method.
envir	Environment in which to assign name
name	The variable to which data will be assigned, and used for the filename – e.g., name = 'regions' will look for 'regions.csv', etc.
xdim	The name of a dimension, and expects get(dimension) to return a valid data frame with 2 columns: region_code, and dimension – e.g., ('region_code', 'status').
...	Arguments passed onto read.csv, write.csv, load, save.

Value

Returns a data.frame with the input data.

See Also

[read.csv](#), [write.csv](#)

Examples

```
## Not run:
d <- ohi.read.csv(data/regions.csv)
names(d)
head(d)

d$label <- toupper(d$label)
ohi.write.csv(d, data/regions.veryloud.csv)

status <- data.frame(region_code=d$region_code, status=rnorm(nrow(d)))
ohi.save.status()

## End(Not run)
```

ohi-tbd	<i>Ocean Health Index: TBD</i>
---------	--------------------------------

Description

TBD

Usage

pkey

Source

tbd

References

tbd

Examples

```
Sys.info()
```

ohi-vars

Ocean Health Index: Global variables

Description

Various variable constants for goals, dimensions, labels, etc.

Usage

```
goals
goals_subgoals
goal_subgoals
ohi.global.regions
ohi.global.regions.eez.noATA
ohi.global.regions.max
ohi.global.regions.noATA
ohi.goal.all
ohi.goal.labels
ohi.goal.subgoal.all
ohi.goal.subgoal.unique
ohi.labels
ohi.model.dimensions
ohi.casestudies
ohi.model.labels
ohi.subgoal.all
ohi.subgoal.parent
ohi.valuesets
schemes
subgoals
```

Format

1. `ohi.subgoal.all` is the list of only the subgoals, or the goal if only 1 subgoal.
2. `ohi.goal.subgoal.unique` is the list of only the subgoals, or the goal if only 1 subgoal.
3. `ohi.goal.subgoal.all` the union of all goals and subgoals.
4. `ohi.subgoal.parent` is the list of subgoals and their parent goal.
5. `labels` is a list to map codes into text labels.

Examples

```
ohi.labels[[A0]]
ohi.labels[ohi.goal.all]
ohi.labels[ohi.goal.subgoal.all]
ohi.subgoal.parent[ohi.subgoal.all]
```

ohi.model.goal	<i>Ocean Health Index: Goal Model</i>
----------------	---------------------------------------

Description

The goal model function.

Usage

```
ohi.model.goal(id,
               status,
               trend,
               resilience,
               pressure,
               DISCOUNT = 1,
               BETA = 0.67,
               default.trend = 0.0)
```

Arguments

id	Region identifiers.
status	Status scores.
trend	Trend values for 5 year outlook.
resilience	Resilience scores.
pressure	Pressures scores.
DISCOUNT	Discount multiplier.
BETA	Multiplier used in likely future status calculation.
default.trend	The default trend value (0) if region has NA.

Value

Returns a data.frame with the input data, and a likely future status and OHI score.

Examples

```
## Not run:
## run a model with 50 regions using random data,
## using 5 year 1-percent discount rate and beta=0.67
require(ohi)
d <- ohi.model.goal(id=1:50,
                    status=runif(50, 0, 1),
                    trend=runif(50, -1, 1),
                    resilience=runif(50, 0, 1),
                    pressure=runif(50, 0, 1),
                    DISCOUNT = (1 + 0.01)^-5,
                    BETA = 0.67,
                    default.trend = 0.0)

## view model output
names(d)
d[,c(id,score,xF)]

## End(Not run)
```

ohi.model.pressures *Ocean Health Index: Pressures Model*

Description

The pressures model function computes a pressures score for each region given a weighting matrix for a goal and the individual pressures values.

Usage

```
ohi.model.pressures(p, w, GAMMA = 0.5)
ohi.pressure.category
```

Arguments

p the pressures value matrix [region_id x pressure]. Each score must be a real number between 0 and 1 inclusive, or NA. The pressure names must be of the form *category_pressure* where *category* is one of the categories listed in `ohi.pressure.category`. Use *ss* to denote the social category.

	pressure			
region_id	cc_acid	cc_sst	cc_uv	fp_art_hb
1	0.879	0.360	0.764	NA
2	0.579	0.396	0.531	NA
3	0.926	0.235	0.769	NA
4	0.914	0.554	0.795	NA
5	0.860	0.609	0.802	0.001
6	0.871	0.325	0.788	0.001

7	0.846	0.410	0.677	0.000
8	0.806	0.671	0.752	NA
9	0.844	0.595	0.678	NA
10	0.860	0.575	0.781	0.109

w the weighting matrix of the form [region_id x pressure]. Each rank weight must be a real number between 0 and 3 inclusive, or NA.

region_id	pressure			
	cc_acid	cc_sst	cc_uv	fp_art_hb
1	2	1	0.6	NA
2	2	1	0.5	NA
3	2	1	2.1	NA
4	2	1	3.0	NA
5	2	1	2.8	1
6	2	1	2.2	1
7	2	1	1.3	1
8	2	1	1.7	NA
9	2	1	3.0	NA
10	2	1	1.2	1

GAMMA Multiplier used to combine environmental and social pressures.

Details

Each pressure layer $p(i, j)$ is either environmental or social, belongs to a pressures category $K \in \{cc, fp, hd, po, sp, ss\}$, and has a value (0..1) for each region i and pressures layer j . Each goal has a weight matrix w that has a rank weight between 0 and 3 inclusive, or NoData, for each region i and each pressure layer j on a per goal g basis.

The pressures scores calculations go through 5 steps, using a complex weighting scheme that varies across goals, subgoals, pressures categories, and regions:

- g is the goal or subgoal (e.g., AO, CW, LIV, ECO, ...),
- i is the region (e.g., 1, 2, 3, ...),
- j is the pressures layer or stressor (e.g., cc_acid, fp_art_lb, etc.).

Calculations

1. Apply weights for each goal g , region i , and pressure layer j : Each weighted pressure $p_w(g, i, j)$ is the pressure layer value $p(i, j)$ per region i and pressure layer j multiplied by the rank weight $w(g, i, j)$ for that goal g , region i , and pressure layer j . If the $w(g, i, j)$ is NoData or 0, the weighted pressure $p_w(g, i, j)$ is NoData.

$$p_w(g, i, j) = w(g, i, j) * p(i, j)$$

2. Category-level aggregation: The pressures category score p_K is the sum of all p_w within each category, then rescaled to 0..1 using a linear scale range transformation (from 0..3 to 0..1). Any score p_K greater than 1 is capped to 1:

$$p_K(g, i) = \frac{\min(\sum_{j \in K} p_w(g, i, j), 3)}{3}$$

3. Environmental aggregation: The environmental pressures score $p_E(g, i)$ is the weighted sum of $p_K(g, i)$, where each weight is the maximum weight in the pressure category K , and then divided by the sum of the maximum weights:

$$w_{K,max}(g, i) = \max(\{w_j \in K | w(g, i, j)\})$$

$$p_E(g, i) = \frac{\sum_K w_{K,max}(g, i) p_K(g, i)}{\sum_K w_{K,max}(g, i)}$$

4. Social aggregation: The social pressures score $p_S(g, i)$ is the mean of the *unweighted* social pressure scores $p(i, j)$:

$$p_S(g, i) = \frac{\sum_{j \in S} p(i, j)}{N}$$

5. Gamma combination: The pressures score $p_X(g, i)$:

$$p_X(g, i) = \gamma p_E(g, i) + (1 - \gamma) p_S(g, i)$$

Value

Returns a named vector with the pressures score for each named region.

ohi.model.pressures.matrix
<i>Ocean Health Index: Pressures Matrix Model</i>

Description

The pressures matrix model function computes a pressures weighting matrix based on regional attributes per category.

Usage

```
ohi.model.pressures.matrix(alpha, beta, calc)
```

Arguments

- alpha the weighting matrix of the form [category x pressure]. Each rank weight must be an integer between 0 and 3 inclusive, or NA.
- beta the aggregation matrix of the form [region_id x category] to collapse across each category.
- calc type of calculation, whether avg (default), mean (diff't from avg?) or presence (results in 1 or 0).

Details

Given:

- g is the goal or subgoal (e.g., AO, CW, LIV, ECO, ...),
- i is the region (e.g., 1, 2, 3, ...),
- j is the pressures layer or stressor (e.g., cc_acid, fp_art_lb, etc.).
- k is the category (e.g., habitat, sector, product, etc.)

There may be a component k for a given goal g such that $p_w(g, i, j, k)$ and $w(g, i, j, k)$.

$$p_w(g, i, j, k) = w(g, i, j, k) * p(i, j)$$

In these cases where there is a component k for goal g , there's an additional aggregation or formula to calculate $w(g, i, j)$ based on the core rank weight $\alpha(g, j, k)$ from the original pressures matrix (as written in Halpern et al. (2012)) and some region-specific data for each category k $\beta(i, k)$.

This function `ohi.model.pressures.matrix` will aggregate a category-specific weighting matrix $\alpha(g, j, k)$ [category x pressure] using region-specific data $\beta(g, i, k)$ into a [region_id x pressure] matrix $w(g, i, j)$ used in `ohi.model.pressures`, such that:

$$w(g, i, j) = \frac{\sum_k \alpha(g, j, k) * \beta(g, i, k)}{\sum_k \beta(g, i, k)}$$

1. For the CP, CS goals, the weight depends on the extent A of habitat k in region i :

$$\beta(i, k) = A(i, k)$$

2. For the HAB goal, the weight depends on the presence of habitat k (i.e., if $A(i, k) > 0$) in region i :

$$\beta(i, k) = hasHabitat(i, k)$$

3. For the LIV and ECO goals, the weight depends on the presence of sector k if data available for region i and sector k :

$$\beta(i, k) = hasSector(i, k)$$

4. For the NP goal, the weight depends on the peak dollar value of each product k across all years (see w_p from SI Equation S27) if data available for region i and product k :

$$\beta(i, k) = w_p(i, k)$$

Value

Returns a weight matrix w [region_id x pressure] suitable for `ohi.model.pressures`.

ohi.model.resilience *Ocean Health Index: Resilience Model*

Description

The resilience model function computes a resilience score for each region given a weighting matrix for a goal and the individual resilience values.

Usage

```
ohi.model.resilience(r, t, w=NA, gamma=0.5)
ohi.model.resilience.matrix(b, w.layers=NA)
ohi.resilience.category
```

Arguments

r	the resilience value matrix [region_id x layer]. Each score must be a real number between 0 and 1 inclusive, or NA.
t	the typing vector t[layer] where values are from ohi.resilience.category.
w	the weighting matrix of the form [region_id x layer]. Each rank weight must be a real number >= 0, or NA for even weighting.
w.layers	the weighting vector of the form [layer]. Each rank weight must be a real number >= 0, or NA for even weighting.
gamma	the gamma constant for $r_{i,x}$ calculation.
b	a boolean value matrix [region_id x layer] which is TRUE if the given region_id should include layer, and FALSE otherwise.

Details

To calculate Resilience for each goal g and region i ($r(g, i)$) we assess three types of resilience measures j : ecological integrity ($Y_E(g, i)$), goal-specific regulations aimed at addressing ecological pressures ($G(g, i)$), and social integrity ($Y_S(g, i)$). The first two measures address ecological resilience while the third addresses social resilience. When all three aspects are relevant to a goal, Resilience is calculated for each goal g and each region i :

$$r(g, i) = \gamma * \left(\frac{Y_E(g, i) + G(g, i)}{2} \right) + (1 - \gamma) * Y_S(g, i)$$

where each goal g is comprised of several resilience layers j where w_j is a configuration-time weight to aggregate across resilience categories:

$$G(g, i) = \frac{\sum_{j \in g} w_j G(i, j)}{\sum_{j \in g} w_j}$$

$$Y_E(g, i) = \frac{\sum_{j \in g} Y_E(i, j)}{N}$$

$$Y_S(g, i) = \frac{\sum_{j \in g} Y_S(i, j)}{N}$$

Value

ohi.model.resilience returns resilience score for each region. ohi.model.resilience.matrix returns a weighting matrix suitable for ohi.model.resilience.

Ocean Health Index: Global Results

Description

This data set contains the scores and model outputs from the Ocean Health Index global study (Halpern et al. 2012).

Usage

```
ohi.nature2012
```

Format

A list containing:

1. regions is a data frame with the id and label for each reporting region (country EEZs).
2. global is a data frame with area-weighted and unweighted global OHI scores, including per-goal scores.
3. valueset is a data frame with the 5 value set (weighting combinations) scores per region.
4. goal is an array of scores as *goal ~ dimension ~ region*.
5. labels is a list to map codes into text labels.
6. layers is a list of layers data from the file archive.
7. countries is a list of country-level data to aggregate into regions.

scoring

Ocean Health Index: Scoring

Description

Scoring functions

Usage

```
score.rescale(x, xlim=NULL, method=linear, ...)  
score.max(x, p=0.0, ...)  
score.clamp(x, xlim=c(0,1), ...)
```

Arguments

x	A numeric vector of data.
xlim	The scoring range. If null, derives range from data.
p	A percentage buffer to add to the maximum value.
method	Only 'linear' is supported.
...	Arguments for min, max, pmin, pmax.

Value

Returns scores.

See Also

min, max, pmin, pmax

Examples

```
score.max(c(0.5, 1, 2))  
score.max(c(0.5, 1, 2), p=0.25)  
score.rescale(c(0.5, 1, 2))  
score.clamp(c(-0.5, 1, 2))  
score.clamp(c(-0.5, 1, 2), xlim=c(-1, 1))
```
